Generative model

EP/K002228/1 - Integrated, Market-fit and Affordable Grid-scale Energy Storage (IMAGES)

It is accepted that UK **energy networks** face a number of unprecedented **challenges** in the upcoming decades. These **challenges** include the threat to the security of **energy supply** due to declining indigenous **fossil fuel** reserves, increased reliance on imported **fossil fuel** (78% of **gas** and 50% of natural **gas** are imported, it is predicted that **gas** import will be over 80% in 2020), and planned retirement of ageing **generation capacity** over the next decade (approximately 20GW or 25% of the existing **generation capacity**); decarbonising **electricity generation** to achieve the goal of 80% reduction in CO₂ **emissions** by 2050; and coping with the future increases in **electricity demand** from electrification of transportation and space heating. To address these great **challenges**, it is recognized that the UK **energy networks** must change, strategically and the existing regulatory arrangements should be examined to check if they are fit for the purpose of future **energy network operations**.

To ensure that **power supply** closely matches **demand**, the amount of **electricity generated** must be well controlled and managed. If the balance between **supply** and **demand** is broken and the difference exceeds a critical level, the **power** system may fail and cause a regional blackout. The UK is especially vulnerable in terms of **network stability** as it has a relatively isolated small island **power network**. Currently, 80% of our **electricity** is generated from **fossil fuel** (**gas** or **coal**) with the **load**

balancing function mainly managed through **fossil fuel peaking generation plants** that respond to **load** changes. The mix of **electricity generation** in the UK will change dramatically with a large reduction in the use of **gas** and **coal** and an increase in the clean variable, intermittent **renewable energy generators**. The inherent **energy storage** capability that we currently enjoy due to our dependence on **fossil fuel power generation** will then be greatly reduced by 2030.

Solutions are needed to address the **network challenges** that will occur due to a decrease in the implicit **energy storage** available with the planned reduction in **fossil fuel power generation** and the integration of large amounts of unpredictable intermittent **renewable sources**. **Energy storage** can provide manifold values in i) help meeting of peaky large scale electrical loads, ii) providing time varying **energy** charge management, iii) allowing **renewable power generation** to be stored to alleviate intermittence, iv) improving **power quality/reliability**, v) meeting remote **load** needs, vi) storage for management of distributed **power generation**, etc. This proposed research programme will focus on the challenging technical and economic issues faced by integrating large **grid scale energy storage** with the **energy network**.

Step 1 – Idea Generation

Short Label	Full Research Topic
OLED Lighting	OLED Lighting
OLED Lighting	OLED Lighting
Origins of Society Transform Stimulants	Where do the stimulants come from to help a society transform
Geographical Factors	What factors accentuate differences geographically or that serve particular communities?
Civil Infrastructure and Industry	The role of (civil) infrastructure in creating a digital economy and how the industry can collaborate to provide insight into the future of a digital economy.
Smart Cities	Smart cities – an emerging economy
New Urban Ecologies	New urban ecologies: how to design resilient socio-technical systems, new supply chain models in an eco-industrial economy?
Methodological approaches	If business model development is systemic, what methodological approaches are suited to the digital economy ecosystem
New Digital Economic Models and People	The people management / development and skill implications of the rise and spread of innovative new digital economic models-
New Digital Economic Models and UK Economy	The implications of innovative new digital business models on the UK economic - particularly its distributive effects on the UK labour market, and the implications of that for the nature of work in the UK
New Business Models via Digital Tech	Typologies of new business models enabled by digital technologies-
Model Co-Evolution with Technology	What, when and how do business models co-evolve with technology
Tech innovation of Business Models	Business Model Innovation process and how technology innovation can be the catalyst
Technology and Business Model Innovation	Digital technology and business model innovation
Sustainable Business Models	Sustainable business models
Business Model Taxonomy Evolution	After more than a decade since the publication of Amit & Zott's (2001) seminal paper on value creation in e-business, has the taxonomy of business model themes (i.e. sources of value creation)

Step 5 –Breakout

Incompleteness and the Digital/Material Divide

The Technological Divide

Incomplete Information

Representation of Users

Big Data and Strategic Decision Making

Big Data in the Public Sector

Big Data and Customer Relationships

Data Science Innovation

Skills for Data Science and Big Data

Social Computation and Cognitive Surplus

The Size of the Internet

Internet Structure and Dynamics

Internet of Things

Red

Big Data and Strategic Decision Making	How can "big data" support strategic decision making, for instance at board level in organisations?
The Size of the Internet	How big is the internet? What metrics are appropriate and how can we reconcile publicly available indicators such as traffic through internet exchanges with commercial trends such as traffic contained in content delivery networks (CDNs) and other private and commercial networks?
Internet Structure and Dynamics	What is the structure and dynamics of the internet and how does it change?
Social Computation and Cognitive Surplus	How can we use social computation to access cognitive surplus, third actor and informal actors to enable co-production of a range of services (e.g., Health and Care)?
The Technological Divide	I would like to see the NEMODE agenda contribute towards bridging the widening technological divide between the least developed countries (LDCs), the emerging economies and the technologically advanced countries.
Incompleteness and the Digital/Material Divide	How does incompleteness span the digital/material divide?
Incomplete Information	In a material world of incomplete or unreliable products and services is there a corresponding world of incomplete information and how does this provide a platform for design, experiment and production of such goods and services?
Representation of Users	Representation of Users
Data Science Innovation	Data science, innovation and business productivity
Skills for Data Science and Big Data	Skills for data science and big data

Step 5 - Gateway to Research Data

	Relevance			
	55.52%			
	54.55%			
	54.09%	ESRC	The Big Society, Localism & Housing Policy	Ⓔ
	53.92%	STFC	Big Science - Big Telescopes	Ⓔ
	53.92%	STFC	Connecting Early Universe Physics to Modern Advances in Observational Astronomy	Ⓔ
	53.87%	STFC	Branes, Strings and Defects in Cosmology	Ⓔ
	53.61%	STFC	Astronomy and Cosmology with the Planck Experiment	Ⓔ
	53.61%	STFC	Theory from the Planck Experiment	Ⓔ
	53.61%	NIERC	Assessing the size of explosive super-eruptions: how big is big?	Ⓔ
	53.09%	STFC	Twistor String Theory and Time-dependent Backgrounds	Ⓔ
	52.91%	STFC	PATT Linked Grant Support for the Bristol Astrophysics Group	Ⓔ
	52.91%	STFC	Project support for the Wide Angle Search for Planets	Ⓔ

Step 5:
output

Big and Open Data

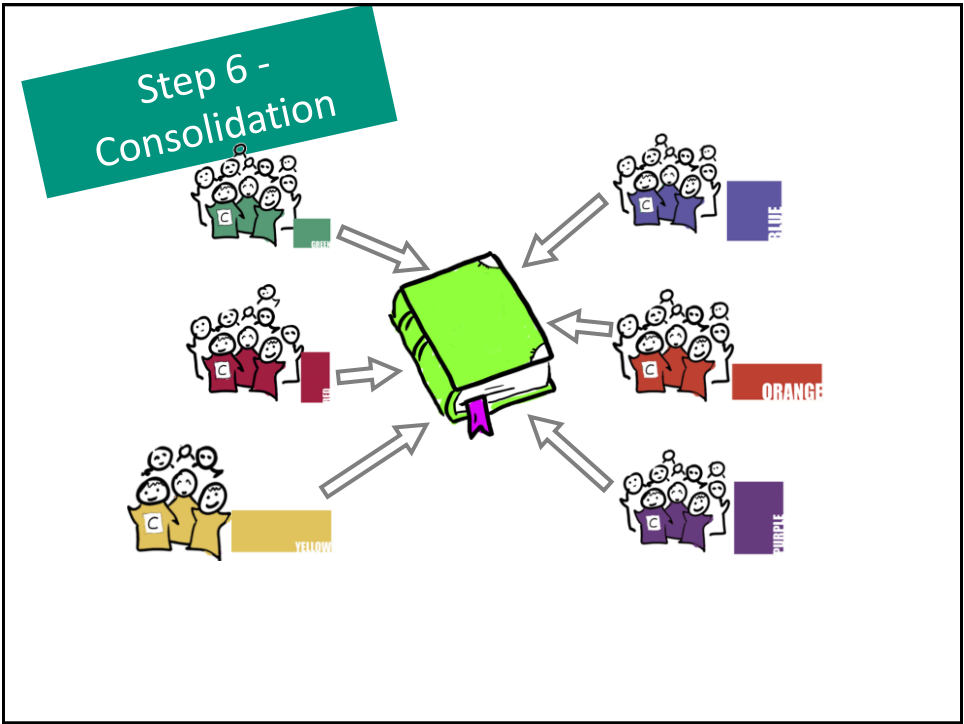

Raconteur Name: Richard Vidgen
Raconteur Email: r.vidgen(at)hull.ac.uk

Group Members:
Richard Vidgen, Nina Marshall, Hasan Bakhshi, Carla Bonina, Maureen Meadows

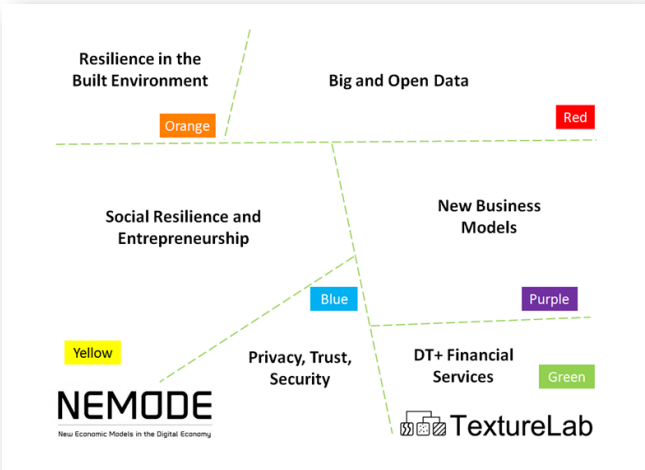

Research Question #1:
What is the value to the UK of open data?
• Value and benefits in terms of economic, social, political and environmental dimensions
• Issues, tensions, and challenges for the nation, organisations and citizens

Research Question #2:
What skills and capabilities do UK organisations need to create value from 'big data'?
• Value of impact on: UK organisations and their business models; creation of new and skilled jobs (e.g., data scientist); and the competitiveness of the UK economy
• Scope includes all stages of big data management, e.g., data collection, data analysis, using big data for business operations, using big data in strategic decision-making...
• Implications for training, education, and policy

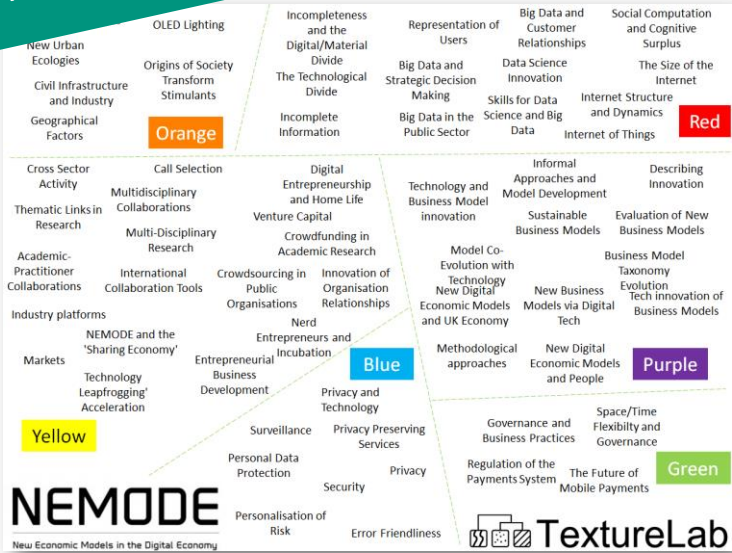

Research Question #3:
What are the opportunities and ethical challenges for randomised controlled experiments (RCTs) around 'big data'?
• We predict that public and private sector organisations will make greater use of big data to run RCTs to test business and public sector offerings
• Although RCTs are a powerful way of getting evidence about what works they also raise ethical concerns: firstly, about the conduct of the RCT itself, and secondly, about how RCT data is used to guide business and policy decisions

Result: top-level

This Meeting

- Provide an overview of interests
 - Illustrate the wide variety of ICT research to attendees
- Ice breaker
- Networking tool and reference
- List of experts
- Provide EPSRC with snapshot of up-and-coming research capability

Suggestions

- Explore
 - GOW, GTR, researchperspectives.org
- Meet lots of folk
 - decide quickly if you can work with them
 - explore **dual complementarities**
 - be polite
 - treat everyone is a potential speaker/reviewer ;)
- Remember the innertube of opportunity
 - Look at other complementary communities
 - **but** maintain your publishing base
- Use the groups diagram
- Organise events
 - and use our tools

Tom Methven
<http://www.well-sorted.org/>

Red	Intelligent and Usable Security and Privacy	I focus on Intelligent solutions to Cybersecurity (Artificial Intelligence, Multi-agent Systems, Privacy, Identity Management, Access Control, Trust and Reputation) in Social Media, Social Network Sites, Cloud Computing and e-Commerce.
	(Re)gaining trust in the security of systems	Even rigorously analysed security systems, e.g., by cryptographic proofs or model checking, can often still be attacked because the analysis did not cover all aspects. How can we improve the analysis methods to (re)gain trust in the security of systems?
	Security and privacy with ubiquitous computing	The increased metricisation of us and the world around us becomes significant, the opportunities and threats associated with security (both cyber and physical) and personal privacy are both interesting and challenging.
	Web-situated Collective Intelligence	It is shown that Web-based CI is effective. However, a better understanding of the interdependencies of social and technical elements is required for the further development of social computing. So, how can we design socio-technical systems empowering CI?
	Semantic Web in (Social) Information Systems	The Semantic Web supports knowledge management and can facilitate systems combining AI and human reasoning. This raises challenges such as data integration, utilising big data, ensuring user privacy, and assessment of e.g. data quality and trust in users.
	Personal Linked Data	Applying Linked Data technologies to personal information to improve the way we work with and control our data.
Blue	Medical Image Analysis and Computation	Using computational techniques to understand the content of medical imaging data, to detect abnormalities, to assist diagnosis and treatment planning, and hopefully to predict clinical outcome.
	Medical Image Computing	My research topic focuses on anatomical shape modelling for image guided surgical intervention. In particular, I am using medical images to develop geometric and motion models of anatomy for improved navigation in minimally invasive surgery.
	Dense 3D Reconstruction for Medical Applications	The ability to reconstruct accurate 3D models of physical objects in real-time enables exciting applications for medical augmented reality.
	Biomedical signal processing	My research area lies on the synergy of digital biomedical signal processing and machine learning. I am interested in automatic detection of knee disease (osteoarthritis) by developing methods for multimodal signal analysis and machine learning.
	Biological Informatics -Computational Neuroscience	Computational neuroscience is a highly interdisciplinary science that studies brain function and behaviour through modelling and analysis, in terms of neural information processing. It is also classified under EPSRC's Biomedical Neuroscience.
	Tracking objects in video sequences	I am interested in applying image processing techniques to following moving objects in complex visual scenes: following cars moving on busy junctions, farm animals roaming, workers at construction sites, etc.
Green	Low power digital signal processing	Circuit and technology innovations for low power hardware giving mobile digital signal processing in wearable sensors for the ageing population. Creating innovative applications and new digital signal processing algorithms.
	Audio signal processing	Audio signal processing is a cross-disciplinary ICT area that combines digital signal processing, machine learning, as well as speech, music, and acoustic technology. My work is on developing models and systems for audio signal analysis.

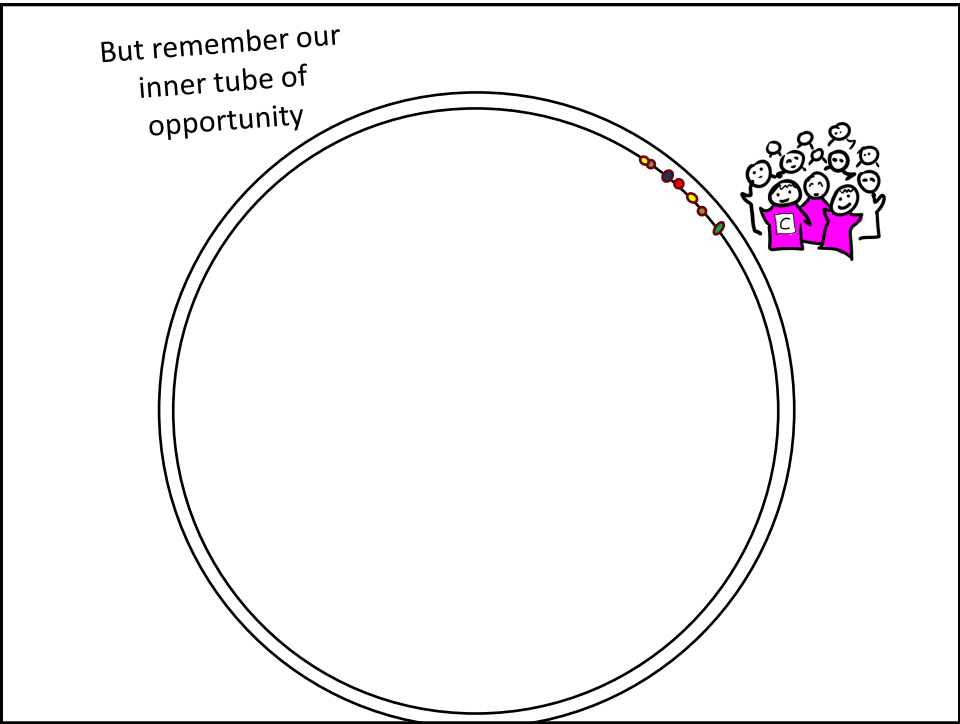

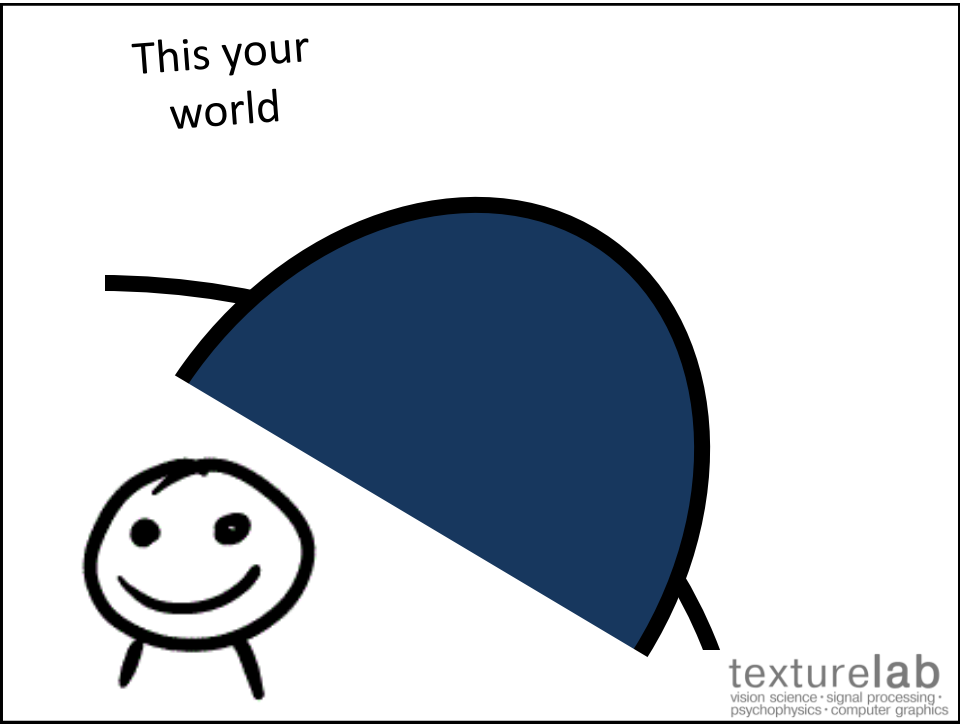

Orange	A new computing paradigm on many-core concurrency	I am interested to translate my concurrency programming knowledge in many-core architectures onto the image processing area. I aim to provide system-wide solutions to visual information processing area for low energy consumption, high performance.
	Optimal execution of multiscale models	Multiscale models couple multiple mathematics and numerics, posing a challenge wrt the optimisation for distributed computational architectures. How they impact on the execution of biomedical multiscale models? Which strategy optimises performance?
	Best Practices in Computational Science	Scientists in many fields publish research based on computational results, but are not usually well-trained in programming or software engineering. Can best practice and cloud computing improve the quality and reproducibility of computer experiments?
	Software Sustainability	Software sustainability has been identified as one of the key challenges in the development of scientific and engineering software. My current research focuses the role of architectural-level reasoning about sustainability.
Purple	Visual tools for operationally complex domains	I am interested in applying graphics and visualisation tools to operationally complex service domains. Tools are linked to AI-enabled information systems, supported by HCI interfaces. Also, I aim to transfer ICT research to built-environment domains.
	Explanatory visualisation of complex data	The design and evaluation of dynamic, interactive visualisations to communicate complex data from one disciplinary area to people from other disciplines, who could apply the data in their own context if it was understandable and in an accessible format.
	Effective Visualisation of Dynamic Networks	I am interested in perceptually effective techniques for the interactive visualisation and drawing of dynamic networks. This topic lies within the areas of HCI and Graphics & Visualisation in the ICT portfolio and draws from the field of psychology
	Computer Graphics and Digital Fabrication	I am interested in developing novel user interface tools, hardware devices, and geometric 3D modelling techniques for advancing the field of computer graphics and for realising the emerging area of digital fabrication.
	Multisensory human-computer interaction	Novel modes of interaction with information aim to simulate embodied interaction and multisensory experiences using virtual reality and related technologies. How might HCI methodologies keep pace with these technological advancements?
	Human Computer Interaction & Learning	Considering the relationship between users and technology, including games, within the context of learning - from promoting health-related behaviour change and public engagement to supporting citizen science and formal educational environments.
	Psychology of hearing/other senses, applied to HCI	I am interested in the psychology of hearing, as well as of multi sensory interaction, to underpin the design and implementation of human computer interfaces that can support wellbeing and rehabilitation.
	Human Computer Interaction (HCI) in Healthcare	HCI helps design and develop new techniques and technologies to address national and global health challenges. Novel technology development within healthcare can raise many challenges including the ethical and social implications of computer interaction.
	Human-centred computing	Using models of human behaviour/cognition/perception to drive technology development.
	Human Action/ Behaviour Analysis	Vision based human behaviour analysis, emotion analysis and facial expression analysis. Multi-sensor signals including image and depth signal processing. Methods I am interested in include machine learning, cognitive and psychological methods

Yellow	Microelectronics Design	My research interests include neural engineering and neural prostheses. The overlying goal of my research is to learn from biology to create more efficient electronic systems and develop technologies for medicine and healthcare.
	Emerging non-CMOS devices	CMOS technology is approaching the nanoscale floor, imposing significant challenges on the performance, reliability, and manufacturability of electronic systems. It is imperative thus to substantiate "beyond-CMOS technologies".
	CMOS-based diagnostic biomedical microdevices	The design of CMOS analogue and mixed-signal microelectronic systems-on-chips and CMOS-compatible sensors, to be combined with microfluidic platforms for low-power, easy-to-use portable and miniaturized biomedical devices for point-of-care diagnostics.
	Optoelectronic Devices and Circuits	Research into the molecular beam epitaxial (MBE) growth of narrow band-gap semiconductors and nanostructures, and the investigation of the underlying physics which determine the efficiency limiting processes in infrared light sources.
	Photonic integrated circuits	Developing novel photonic materials and optoelectronic devices for manipulating and moulding the flow of light. This also involves developing new nanoscale fabrication techniques and combining multiple device elements into a single integrated circuit.
	Quantum Technologies	The transformation of quantum information science into quantum technologies, and eventually a new industry, is very topical given recent funding announcements. I want to know how universities and industry can optimise the chances of success in this area.
Pink	Wireless Sensor Networks and Internet of Things	Topics related to the efficiency and robustness of WSNs' structure, routing and in-network localization; also things on a higher level about sensor and WSNs data modelling, processing, aggregation and sharing both in-network, cross-network and on IoT.
	Energy Harvesting Communication Networks	Wireless networks of nodes running on harvested ambient energy present unique design challenges. My research focuses on the design of intelligent communication protocols to exploit limited and intermittent energy in the most efficient manner.
	Microwave antennas	Design and optimisation of antennas for wireless communication at microwave frequencies. This includes wearable (incl. embroidered) or inkjet printed antennas; use of metamaterials; 3D printed substrates and advanced synthetic materials
	RF and Microwave Devices and Communications	My future research area will be on 4G and 5G communication systems including power amplifiers, receivers and transmitters up to 100GHz. I am also interested in wireless energy harvesting using rectennas.
	RF & Microwave Communication	Body-Centric antennas & propagation for healthcare applications. Enabling technology for intelligent wireless sensor networks.
	Dynamic spectrum access/cognitive radio systems	Cognitive spectrum and radio resource management, spectrum monitoring/measurements, statistical modelling of spectrum occupancy, spectrum sensing techniques, prototyping and experimental evaluation of DSA/CR solutions.
	Optical Wireless Communications.	Providing ubiquitous connectivity via the application of Optical Wireless as a complementary technology to the currently established wired and conventional RF wireless systems.
